New EuroTier product
WEDA 4PX.Trac

WEDA 4PX Trac

Large display for all devices

The newly developed 4PX.Trac programme is a large display for tablets, smartphones or other internet-enabled devices, which helps the farmer on the wheeled loader to precisely meter his feed recipe into the tank. At a glance, he can see what quantities he has already loaded into his tank and what quantities of other products still need to be loaded. Therefore, it is immediately apparent what needs to be done.

Due to increasing costs of feed, it is extremely important for the farmer to feed his own or cheaply purchased by-products of the food industry, such as bread, chocolate, potato products, brewer's spent grain, CCM, sugar beet, maize silage, or similar. Ideally, this can be mixed and fed within a liquid feed.

These by-products are usually removed from the horizontal silo with a wheel loader during the daily work routine. However, the large display on the premixing tank always shows only the quantity that is still needed. Reading the display is often very difficult, so finding the exact blend is more often than not a game of chance. Furthermore, it is not shown which of the following components have to be retrieved. With the 4PX.Trac, you can see at a glance on the wheel loader what quantities have already been loaded into the doser and what still has to be added according to the feed recipe.

The 4PX.Trac in action

WEDA 4PX.Trac

Everything important at a glance

Previous large displays only show the current quantity that is in the doser. One does not know exactly what quantities of the by-product have been loaded before or what is still to follow. If, for example, the quantity has not quite been reached then (missing 20 kg, for example), an error message simply appears, and you don't know what this message means. Furthermore, it is not shown which component has to be retrieved and what the next component is. This is only possible if you remember or write down the individual steps.

The solution is the newly developed large display 4PX.Trac for tablets, smartphones or any other internet-enabled device. The farmer is presented with the previously defined quantities on a tablet in large display, which he mounts on the wheel loader or is already present. Once the determined quantity of a certain by-product has been reached, it is simply displayed.

The farmer confirms the loading process with the touch of a finger and is then prompted to load X amount of the next product. It is clear at a glance what needs to be done – but you can also simply confirm and jump to the next step. This enables the farmer to work more accurately, save time and work more effectively, as well as achieve an improved and more accurate composition of the feed recipe.

4PX.Trac: everything at a glance through straightforward presentation
